Kilambi Research Working Paper No. KR-WP-2026-25

Ninety-Five Percent Unattributed: A Counterparty Forensic of AI-Infrastructure Lease Obligations

Kilambi Research

arvin@kilambi.com

October 2026

Abstract. Seven companies disclose about $1,165 billion of signed-but-not-yet-commenced AI-infrastructure lease obligations. This paper asks who sits on the other side of those leases: which developers, landlords, and special-purpose vehicles are the counterparties, and how much of the book can be tied to a named name. We ran 46 forensic workstreams against a first-principles map of every legally mandated filing a large US data-center campus triggers, rebuilt the lease-dollar lineup quarter by quarter, and adjudicated every candidate identification into Strong, Plausible, Weak, or Unattributed buckets. The result: $38.85 billion (3.3%) is Strong-attributed to identified counterparties, $14.00 billion (1.2%) is Plausible on a conservative floor proxy, and $1,112.15 billion (95.5%) is unattributed. The unattributed remainder is a measured quantity, not an argument from ignorance: we verify that no US disclosure regime requires a lessee to name its lessor or a lessor to name its tenant as a general rule, so every identification in this program flows through side doors (rating-agency presales, registry renames, BDC schedules, N-PORT filings, utility dockets, permits). Along the way we produce twelve previously unreported findings, including the first named-tenant/named-guarantor AI-campus lease (Saline Township, Michigan: Oracle America Cloud Services LLC, guaranteed by Oracle Corporation), the Delaware registry renames that resolve Oracle's Jupiter tenant vehicle, a reconstruction showing Oracle (not OpenAI) signs the Stargate site leases, and NPORT holder maps showing that roughly 95% of two campus note issues sits with holders no public filing can see.

Keywords: artificial intelligence; infrastructure finance; counterparty identification; uncommenced leases; lease accounting; disclosure; special-purpose vehicles; forensic finance

JEL Classification: G23, G32, M41, E44

Non-technical summary

The largest technology companies have signed about $1.2 trillion of data-center leases that have not started yet. The accounting rules make them disclose the total, but not who the landlord is. This paper tries to put names to those leases: which companies and investment vehicles are actually building the campuses and collecting the rent.

We searched every public record a large data center must create: property deeds, power-utility dockets, air permits, tax-abatement agreements, corporate registries, bond filings, and fund holdings. We found that the law is the reason so little is visible: no American disclosure rule requires a tenant to name its landlord, or a landlord to name its tenant. Every name we did find came through side doors, such as a bond rating report that happened to name the tenant, or a corporate registry that showed an old shell company renamed to an Oracle subsidiary.

The bottom line: of the $1,165 billion, we could tie $38.85 billion (3.3%) to named counterparties with stated lease terms, and another $14 billion (1.2%) to a conservative estimate for one Oracle campus in Michigan. The remaining $1,112 billion (95.5%) cannot be tied to any counterparty with the public record available. That is not a failure of the search; the search covered 46 separate lines of inquiry and the missing 95.5% is itself the finding. It means the question "who is owed the rent on the AI buildout" has almost no public answer, and anyone pricing the credit risk of these structures is doing so with the counterparty column nearly blank.

Along the way we documented twelve findings that had not been reported before, including the first AI-campus lease that names both the tenant and the corporate guarantor, the paper trail showing Oracle (rather than OpenAI) is the actual tenant across the Stargate sites, and evidence that about 95% of two campus bond issues is held by investors no public filing identifies.

1 Introduction

The question this paper answers is narrow: of the roughly $1,165 billion of signed-but-not-yet-commenced AI-infrastructure lease obligations disclosed by seven companies, how much can be tied to an identified counterparty, and what does the unattributable remainder consist of. The answer is a measured one. After 46 forensic workstreams across every layer of the legally mandated disclosure surface, $38.85 billion (3.3%) is Strong-attributed to named counterparties with stated lease economics, $14.00 billion (1.2%) is Plausible on a single conservative floor proxy, and $1,112.15 billion (95.5%) is unattributed (Reconstructed, B). The unattributed remainder is the finding, not the residual: it is bounded by a verified governing limit (no US regime requires lessee-to-lessor or lessor-to-tenant naming as a general rule) and it survives every sensitivity the record supports.

Three facts make the question urgent now. First, the scale and speed of the signing wave. Uncommenced lease balances at the seven filers rose from under $150 billion in early 2024 to $1,165 billion by mid-2026 (Observed, A), with the largest single-quarter jumps carrying almost no counterparty information: Microsoft added $132.5 billion in the June 2026 quarter with roughly $120 billion unexplained, Meta added $106.6 billion in the March 2026 quarter on a chief-executive statement alone, and Oracle added $148.2 billion in the November 2025 quarter with no lease dollars disclosed in any primary record (Observed, A)/(Reconstructed, B). Second, the financing structures behind the campuses are increasingly complex: multi-billion-dollar bank construction facilities, 144A note issues, industrial-revenue-bond tax structures, and developer joint ventures, each of which names different parties in different documents. Third, credit markets have begun to price the opacity: the Beignet/Hyperion notes drifted to about 91 cents by October 2026, the Jupiter construction loan was quoted at 89 to 91 cents in September 2026 with syndication stalled, and the El Paso campus bonds priced at junk-like yields on weak demand in August 2026 (Observed, B).

This paper makes four contributions. First, it produces the measured attribution: the $38.85B/$14.00B/$1,112.15B waterfall with per-company splits and explicit adjudication rules, on definitions consistent with the companion forensic paper (Kilambi Research, 2026). Second, it verifies the governing limit that makes the unattributed remainder a credible quantity: an independent legal verification of every claimed disclosure requirement, establishing that names enter the public record only through side doors. Third, it reports twelve previously unreported findings (Section 6, Table 5), from the first named-tenant/named-guarantor AI-campus lease to the registry renames that resolve Oracle's tenant vehicles. Fourth, it publishes the null results with their evidentiary weight: the searches that came up empty are findings about the disclosure regime, not gaps in the work.

What this paper does not claim matters as much as what it does. It does not allege that any structure is non-compliant: the silence of the filings is, in the main, the law working as written. It does not forecast default or distress. It does not fill the unattributed remainder with estimates; Weak buckets carry $0.0B in dollars at every company because assigning dollars to named-but-unsized tenancies would be fabrication. And it does not treat the unattributed 95.5% as a shrug: Section 6.3 shows why it is a measured quantity, Section 6.9 lists exactly what would shrink it, and Section 6.10 states what would prove the headline wrong.

The rest of the paper proceeds as follows: Section 2 describes the institutional setting, the accounting for uncommenced leases, and the disclosure surface; Section 3 reviews the related literature; Section 4 describes the data and the evidence-grading standard; Section 5 sets out the methodology; Section 6 presents the results; Section 7 states the limitations, sensitivities, and robustness checks; Section 8 concludes. Appendix A carries the supplementary tables, Appendix B the data appendix, and Appendix C the production note.

2 Institutional background

2.1 Uncommenced leases and why they matter

Under ASC 842, a lessee recognizes a right-of-use asset and a lease liability when a lease commences. Leases that are signed but not yet commenced sit one step earlier: ASC 842-20-50-3(b) requires disclosure of the total future payments, the expected commencement timing, and the term, but not the counterparty, the campus, or the per-lease amounts (Observed, A). For the seven companies in this paper, those disclosed-but-unrecognized totals are: Microsoft $329.1B, Meta $279.0B, Oracle $260–288B, Amazon $137.2B, Alphabet $85.2B, CoreWeave $35.5B, Nvidia $25.0B, all measured at June 30, 2026 except Oracle (August 31, 2026) and Nvidia (July 26, 2026) (Observed, A), consistent with the companion paper (Kilambi Research, 2026). The aggregate is $1,165B at Oracle's $274B midpoint, $1,151B at the $260B endpoint, and $1,179B at the $288B endpoint.

Two features of these balances make counterparty identification both valuable and hard. First, they convert to on-balance-sheet liabilities automatically as leases commence on a pre-signed schedule, with no new financing decision required; the credit exposure is already contracted. Second, the disclosure gives analysts the total but no decomposition, so the question "to whom is this owed" has no filing-level answer. Figure 1 shows the signing wave: balances were under $150B in early 2024 and the 2025–2026 ramp is concentrated in a small number of very large quarterly jumps.

2.2 How the campuses are financed

A large AI campus typically involves four layers. The tenant (a hyperscaler or neocloud) signs a long-dated triple-net lease, often 15 to 20 years, with a developer-owned special-purpose vehicle. The developer funds construction with a bank construction facility (the $38B Stargate mini-perm, the $18B Jupiter facility) and frequently refinances into 144A notes once the campus is leased (Beignet $27.294B, Saline $14B, Helios $3.507B, Sopaipilla $12.55B, Digital Drive $1.1B, Elk Grove $900M) (Observed, A)/(Observed, B). Tax-abatement structures sit alongside: New Mexico industrial revenue bonds (Jupiter's $165B ceiling), Missouri Chapter 100 conduit bonds (Port KC's $10B Mica and $100B Kestrel authorizations), Texas Chapter 312 abatements. Equity comes from the developer, infrastructure funds (Blue Owl, Blackstone, BlackRock), and sometimes the tenant itself (Meta's 20% in the Beignet and Sopaipilla JVs).

Each layer names different parties in different documents, and none of the layers is required to name the tenant. The bank facility names the borrower SPV and the lenders. The 144A offering names the issuer and sometimes the tenant (rating-agency presales are the richest source). The tax-abatement ordinance names the company receiving the abatement. The tenant's own filing names nothing. Reconstructing one campus means joining these documents across layers, which is what the deal anatomies in Section 6.5 do.

2.3 The governing limit

The methodology spine of this paper is a verified legal finding: no US disclosure regime requires a lessee to name its lessor, or a lessor to name its tenant, as a general rule. ASC 842-20-50-3(b) requires totals and expected commencement, not counterparty names. ASC 280-10-50-42 requires major-customer amounts and segments at the 10% threshold but not names, which is why REIT

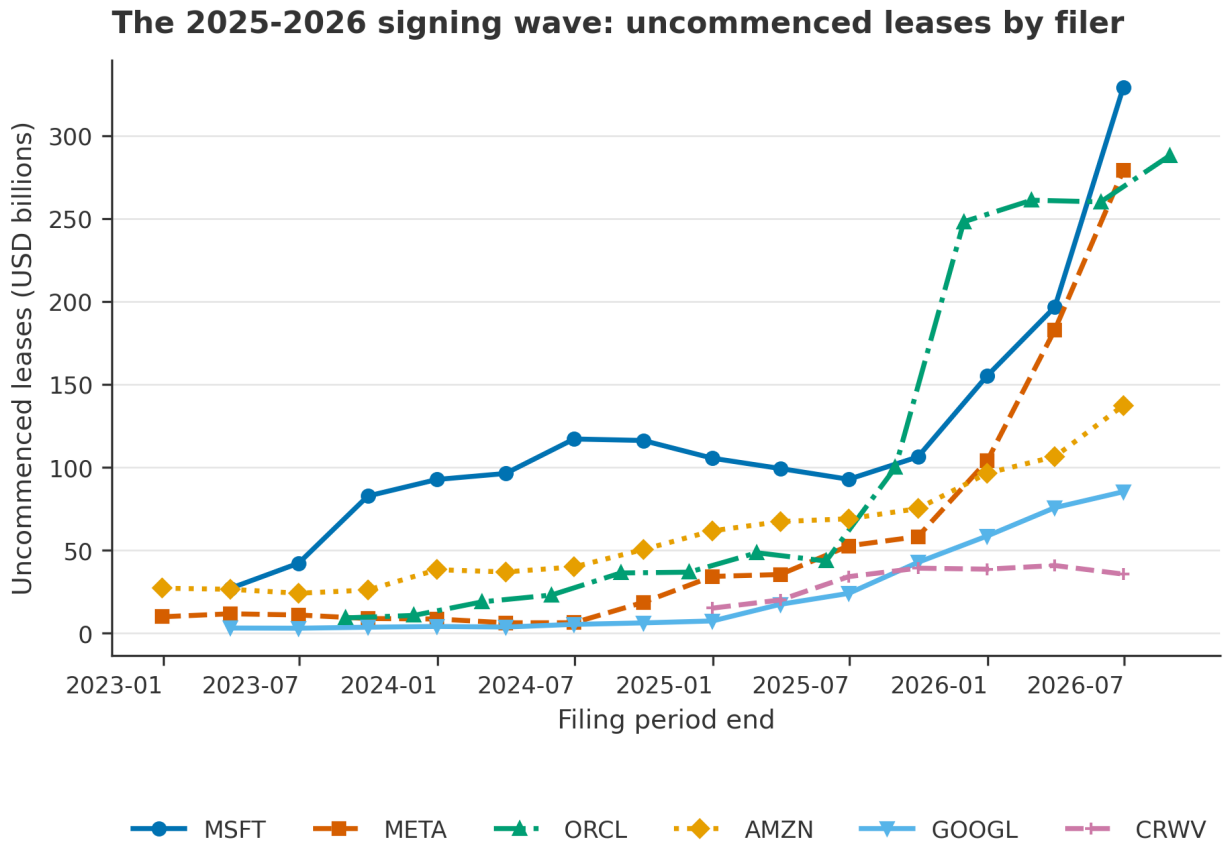

Figure 1. The 2025–2026 signing wave: uncommenced leases by filer.

Note: From the lease-timeline panel (1,327 rows, 19 companies, Q1 2023–Q2 2026). Nvidia's uncommenced series is a single $25.0B observation (July 26, 2026). Oracle's fiscal quarters end in February, May, August, and November.

Source: EDGAR 10-K/10-Q filings via the lease-timeline analysis.

percentage-without-names disclosures are fully compliant. Reg S-K Item 601(b)(10)(ii)(B) makes data-center leases ordinary-course contracts, so zero filed lease exhibits (for example at Microsoft) is the compliant outcome, not evasion. Every counterparty identification in this program therefore flows through side doors: Reg AB Item 1112 (significant-obligor naming at 10% pool concentration), BDC investment schedules (Reg S-X 12-12: every holding named, no materiality threshold), FERC Electric Quarterly Reports (named wholesale customers), Form D related persons, proxy Item 404 related-party transactions, permits, deeds, and utility records. Table 4 catalogs the side doors with their legal basis and what the program found at each. This paragraph is what makes the unattributed remainder a measured quantity rather than an argument from ignorance, and Section 6.3 develops the point as a formal exhibit.

3 Related literature

This paper sits at the intersection of three literatures: the accounting of leases and special-purpose entities, the economics of shadow banking and financial crises, and the case literature on accounting-driven failures. We take from each only what the forensic question requires.

The lease and SPE accounting literature establishes why the current disclosure regime looks the way it does. Feng et al. (2009) document the determinants of special-purpose-vehicle use and show that SPEs are associated with earnings management, which is the empirical basis for the post-Enron consolidation reforms (FIN 46, now ASC 810) whose bite this paper tests from the disclosure side. Dechow et al. (2010) survey earnings quality and the channels through which accounting choice obscures performance; their framework disciplines our distinction between compliant-but-opaque structures and non-compliant ones. The lease-capitalization literature summarized in the IASB/FASB basis for conclusions to IFRS 16 and ASC 842 established that operating-lease obligations are economically debt-like, which is why uncommenced leases are the right population for a counterparty forensic: they are the fixed obligations whose counterparties the filings hide most completely. The standards themselves are the product of the earlier cases: FIN 46 (now ASC 810) was written against Enron's SPEs, and ASC 842/IFRS 16 against the off-balance-sheet operating lease. That lineage is why the governing limit in Section 2.3 reads the way it does: the current framework was designed to put the economics on the balance sheet, not to name the counterparties.

The shadow-banking and crisis literature supplies the structural vocabulary for interpreting the funding side. Pozsar et al. (2010) map the US shadow banking system and show how credit intermediation outside the bank perimeter reproduces bank-like fragility without bank-like supervision; their perimeter concept is the lens through which we read the private-credit funding of AI campuses. Gorton and Metrick (2012) analyze the run on repo as the crisis's transmission mechanism; the analogue we test is whether the campus financing chain contains runnable or mark-sensitive funding (we find the sensitivity is real in construction finance and 144A marks, but there is no deposit-like run dimension). The funding-liquidity spiral formalized by Brunnermeier (2009) is the mechanism to watch in the syndication overhangs documented here (the $38B Stargate facility spent more than six months undistributed). The official investigations, Financial Crisis Inquiry Commission (2011), document the originate-to-distribute incentive failures and SPV mechanics that define the GFC case; our verdict is narrower and forensic: the funding architecture rhymes while the asset quality is not in question.

The case literature anchors the forensic method. The Powers Report (Powers et al., 2002) is the primary record on Enron's SPEs and the related-party opacity channel; our registry work (Section

6.5) applies the same method in reverse, tracing renamed SPVs back to their parents through file numbers rather than names. The Valukas examiner report (Valukas, 2010) is the canonical statement of "GAAP-compliant but economically misleading" reporting; we use it as the precedent for why compliance is not the end of the analysis, even though we find no evidence of non-compliance here.

Finally, the AI capex literature within this working-paper series. Kilambi Research (2026) (KR-WP-2026-24) reconstructs the obligation-level exposure maps for eleven builders and funders and is the source of the uncommenced-lease endpoints used here; we cite it by number and do not duplicate its stress tests or historical comparisons. This paper's distinct contribution is the counterparty dimension: who sits behind the lease obligations that Kilambi Research (2026) measures.

4 Data

4.1 Sources, coverage, and sample period

The bottom line on the data: the analysis rests on the Phase 2 analytical record of the counterparty-forensics program (retrieved October 12, 2026): 46 forensic workstreams, a 1,327-row lease-timeline panel, a 35-row lease-dollar lineup, a 348-row coverage matrix, a 131-node/141-edge counterparty network, 177 N-PORT holder rows, and seven deal anatomies. Table 1 summarizes the evidence base. The measurement date for the attribution is June 30, 2026 (Oracle August 31, 2026; Nvidia July 26, 2026), consistent with Kilambi Research (2026). Uncommenced-lease definitions follow that paper throughout; the known definition gap between 10-K "not yet commenced" lines and the paper-24 endpoints (for example Meta $103.77B versus $279.0B) is carried as a caveat in Section 7, not resolved here.

Table 1. Summary statistics: the Phase 2 evidence base.

Item	Count / value
Forensic workstreams	46
Lease-timeline rows (19 companies, Q1 2023–Q2 2026)	1,327 (Observed, A)
Lease-dollar lineup rows	35 (Reconstructed, B)
Uncommenced-lease total (ORCL at $274B midpoint)	$1,165B (Observed, A)
Attribution audit rows	31 (Reconstructed, B)
Coverage-matrix rows (29 campuses × 12 source types)	348 (Reconstructed, B)
findings / null / not-attempted / not-applicable	121 / 60 / 155 / 12
Counterparty-network nodes / edges	131 / 141 (Reconstructed, B)
N-PORT holder rows (3 note issues)	177 (Observed, A)
13F-HR positions screened for 144A CUSIPs	∼54,000 (Observed, A)
Cloud-bucket queries (3 rounds)	187 (Reconstructed, B)
Deal anatomies	7 (Reconstructed, B)
Tier-validation verdicts	11 confirmed, 2 refined, 2 flagged
Measurement date	2026-06-30 (ORCL 2026-08-31; NVDA 2026-07-26)
Data vintage	2026-10-12

Source: Counterparty-forensics Phase 2 record, October 12, 2026. Grades: filing-sourced counts (Observed, A); desk-built panels (Reconstructed, B).

Primary sources include EDGAR filings (10-K/10-Q footnotes, 8-K exhibits, BDC schedules, N-PORT, Schedules 13D/G, the SB Energy S-1 with executed lease exhibits 10.28/10.29), state records

(Dona Ana County IRB ordinances, MPSC and PUCT dockets, the KBRA Saline presale, Companies House charge and officer filings), and reputable secondary reporting where primary records are paywalled or sealed. Every material figure carries an evidence grade; grades govern provenance, not certainty.

4.2 Evidence grading

Every number in the paper carries a two-dimensional grade: provenance (Observed = stated in a cited primary source; Reconstructed = built from primary sources by the desk; Modelled = produced by the desk's models; Assumed = an explicit modeling input) and quality (A = official/primary or corroborated; B = reputable secondary or single primary; C = provisional). The (Level, Grade) macro renders these in the text. For the attribution exercise specifically, four adjudication buckets are used: Strong (named counterparty with stated lease economics in primary sources, or a filing-stated lease obligation with a named counterparty), Plausible (counterparty identity Strong but dollars are a conservative floor proxy), Weak (named but unsized tenancies; $0.0B in dollars at every company, because assigning dollars would be fabrication), and Unattributed. Section 5.2 gives the exact adjudication rules.

5 Methodology

5.1 The lease-dollar lineup

For each company's largest quarter-over-quarter jumps in uncommenced leases (and Nvidia's guarantee jump), the best campus-level evidence is lined up with an explicit link type and grade. Link types: *lease-filing* (a filing states the lease dollars), *announcement-alignment* (press announcement matches in timing and subject), *campus-evidence* (campus records establish tenancy without a matching announcement), *company-attributed* (the company itself quantified the jump but named no counterparty), *filing-to-press* (filing and press agree on amount and parties), *subsequent-event* (post-measurement, excluded from the total), and *unattributed* (no link; a finding). The lineup has 35 rows; Table 2 summarizes it by company. No counterparty was invented to fill a jump: "unknown" means unknown.

5.2 Attribution adjudication

The attribution waterfall assigns every dollar of the $1,165B to one of four buckets under fixed rules. *Strong* requires a named counterparty and stated lease economics in primary sources (the four CoreWeave campus leases; Meta's $12.31B Hyperion commitment in its 10-K). *Plausible* requires Strong-grade identity with dollars as a conservative floor proxy (exactly one item: Saline, where the $14B is the landlord SPV's 144A notes and Oracle's lease payments must exceed it). *Weak* is named-but-unsized tenancies at $0 (Abilene, Jupiter, Frontier/Lighthouse, Monarch's unnamed tech giant). *Unattributed* is the remainder. Exclusions enforced by rule: conduit/tax-abatement ceilings (Jupiter $165B, Mica $10B, Kestrel $100B) are not lease dollars; developer-side construction debt ($38B Stargate, $18B Jupiter) is not lessee lease dollars; BDC lender positions are memo-only; the Nscale–Microsoft $43.8B is a global take-or-pay services contract, not a lease; Sopaipilla is timing-excluded (JV announced July 28, 2026, after measurement). Both the Strong-only headline (3.3%) and the Strong-plus-Plausible headline (4.5%) are reported throughout.

5.3 Network and concentration

The counterparty network is rebuilt from the round-1 graph on the site memos, N-PORT, bonds, FOIA/corporate, county, and foreign-filings depth: 131 nodes, 141 edges, with build rules of no invented edges (every edge cites a workstream row), amounts in USD billions left blank where undisclosed, and edge types distinguished by line style. Grade composition: 37 Observed A, 79 Observed B, 15 Observed C, 10 Reconstructed; 77 of 141 edges are unquantified. Concentration is measured per lessee on the attributable sample only, with the explicit warning that ratios on a 4.5% sample are illustrative, not representative; the structural concentration findings (Blue Owl across four clusters, Vantage as the Stargate construction nexus) carry more weight than the ratios.

5.4 Tier validation

The paper-24 Tier D (uncommenced leases) and Tier E (economic fixed obligations) inputs are re-checked against the Phase 2 evidence: 11 confirmed, 2 refined (CoreWeave's identified subset rises $10.4B; Nvidia's Tier E gains a $105B SB Energy residual-value guarantee to verify), 2 flagged (Nvidia's $2.3B Tier D definition gap stands; Meta's Sopaipilla exclusion stands). Q3 2026 10-Qs were not filed as of October 11, 2026; all timelines end at Q2 2026.

5.5 Counting rules and integrity

Paper-24 uncommenced-lease definitions are used throughout. Memo rows (press-reported, talks-stage, lender-side duplicates) are excluded from aggregates. Corrections enforced with no regressions: Sopaipilla timing; Nscale $43.8B global-not-Narvik and services-not-lease; IRB/conduit ceilings are tax pass-through, not lease commitments; Digital Realty's Oracle 9.0% is recognized revenue, not uncommenced. This is a retrospective analysis; there was no pre-registered plan.

6 Results

6.1 The lease-dollar lineup: quarterly jumps versus campus evidence

Two Strong lease-filing links anchor the lineup. First, Meta's September 2024 +$12.3B jump matches the $12.31B initial Hyperion lease commitment stated in Meta's 10-K FY2025 Note 5 (Pelican Leap LLC, a 100% Meta subsidiary, lessee of all 11 Hyperion data centers via Beignet Investor LLC; leases commence 2029; 4-year initial terms with one-sided 4-year renewals to 20 years; triple-net; a separate ∼$28B declining residual-value guarantee) (Observed, A). The signing quarter is inferred from the amount match; the grade is Strong on amount, Plausible on timing. Second, CoreWeave's four campus leases total $26.54B: Applied Digital Polaris Forge 1 $11.0B (Observed, A), Galaxy Helios Phase II $10.4B (Observed, B), Blue Owl Digital Drive $2.94B (Observed, B), and Elk Grove Village $2.2B (Observed, C), all uncommenced at the measurement date. One Strong filing-to-press link (not a lease): Nvidia's $105B SB Energy residual-value guarantee of August 2026, with the customer (an OpenAI Group PBC affiliate) named in Nvidia's own 10-Q (Observed, A); a Tier E guarantee item, not a lease.

The new Strong candidate that stays Plausible is Saline. The KBRA presale of May 2026 is the program's first named-tenant/named-guarantor lease document: four triple-net leases to Oracle

America Cloud Services LLC, guaranteed by Oracle Corporation, 974 MW, substantial completion December 2026 to January 2028, date-certain rent commencement, no tenant termination for late delivery (OBSERVED, B). It stays Plausible because the $14B is the landlord SPV's bond principal, not Oracle's lease obligation; the lease payments service 7.5% notes to 2045, so the lease's nominal total exceeds $14B by an undisclosed margin and $14B is a conservative floor proxy, labeled as such.

Table 2 summarizes the 35-row lineup by company. The pattern is stark: CoreWeave is the only filer whose jumps are substantially explained by named leases; every other filer's largest jumps are mostly or entirely unattributed. Figure 2 plots the largest unattributed jumps: Nvidia's four supply-commitment jumps ($249.2B, no matching announcements), Oracle's November 2025 quarter ($148.2B, no lease dollars in any primary record), Microsoft's June 2026 quarter (∼$120B of $132.5B unexplained), and Meta's March 2026 quarter ($106.6B, company-attributed on the earnings call with no counterparties named).

Table 2. Lease-dollar lineup summary by company.

Company	Uncommenced ($B)	Lineup rows	Strong lease-filing ($B)	Largest unattributed jump ($B)
Microsoft	329.1	5	0.00	∼120.0 (Jun 2026)
Meta	279.0	7	12.31	106.6 (Mar 2026)
Oracle	274.0	6	0.00	148.2 (Nov 2025)
Amazon	137.2	6	0.00	90.9 (five quarters)
Alphabet	85.2	5	0.00	61.7 (four jumps)
CoreWeave	35.5	4	26.54	0.0
Nvidia	25.0	5	0.00	249.2 (supply; four jumps)

Notes: Oracle at the $274B midpoint. Nvidia's $105B SB Energy item is a filing-to-press *guarantee* (Tier E), not a lease; Google's $474.3B Note 10 surge is a Broadcom TPU supply event, lined up as context only. *Source:* Lease-dollar lineup, 35 rows (Phase 2).

Material timing caveats apply. The Helios Phase II lease is dated August 8, 2025 (as amended) but CoreWeave's September 2025 quarter shows only +$5.1B; the full $10.4B evidently built through amendments across later quarters, so attribution is to the June 30, 2026 total, not to a specific quarter. The Digital Drive lease signing date is undisclosed and its $1.1B notes priced September 23, 2026, after measurement; if the lease was signed in Q3 2026 it belongs in subsequent events, and it is kept in Strong dollars per the round-1 convention with this caveat flagged. Sopaipilla is excluded by rule (JV announced July 28, 2026; $12.55B is bond principal, not the lease commitment).

6.2 The attribution waterfall: the main results

Table 3 is the paper's main-results table. Of $1,165B in uncommenced AI-infrastructure lease obligations (Oracle at the $274B midpoint): $38.85B (3.3%) is Strong-attributed to identified counterparties, $14.00B (1.2%) is Plausible (the single Saline floor proxy), $0.00B is Weak in dollars, and $1,112.15B (95.5%) is unattributed. Strong plus Plausible is $52.85B (4.5%). Figures 3 and 4 show the per-company and aggregate pictures.

The Strong $38.85B decomposes as: Meta $12.31B (Hyperion, Pelican Leap LLC via Beignet Investor LLC); CoreWeave $26.54B (Applied Digital $11.00B, Galaxy Helios $10.40B, Blue Owl Digital Drive $2.94B, Elk Grove Village $2.20B). Every Strong dollar traces to a stated lease obligation with a named counterparty. The adjudications that kept dollars at zero are as informative as the admissions: the Stargate Abilene Oracle 15-year lease (identity Strong, dollars undisclosed), the Jupiter 18-year

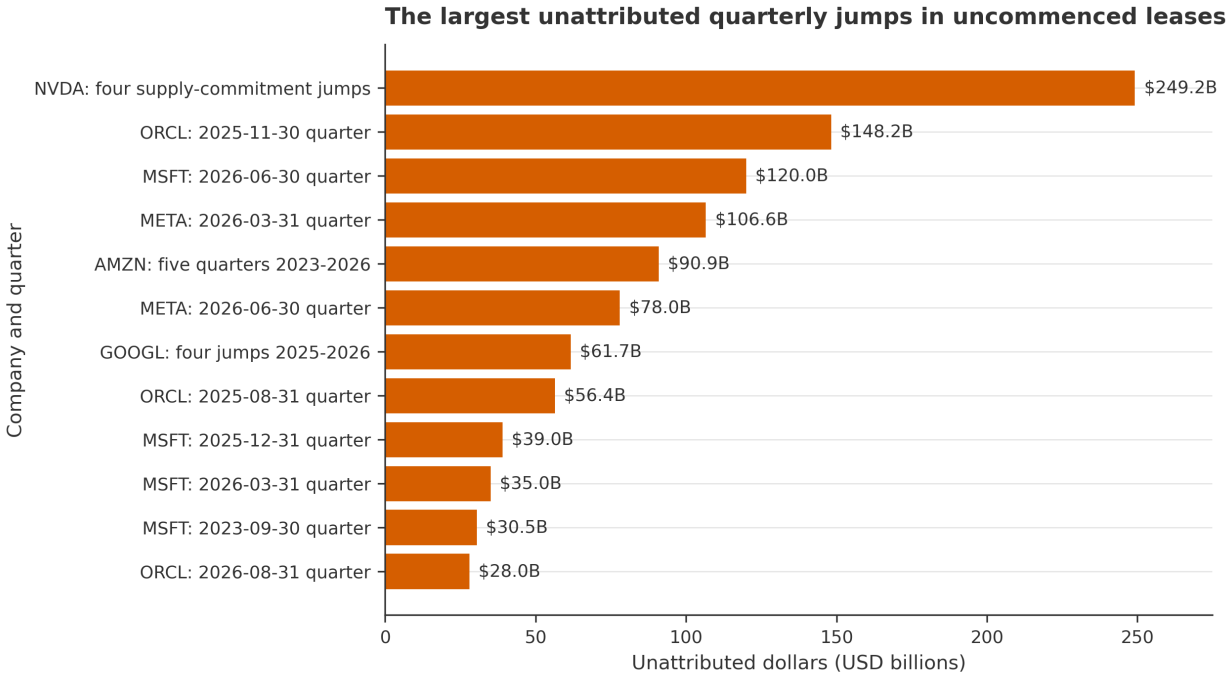

Figure 2. The largest unattributed quarterly jumps in uncommenced leases.

Note: Amounts are the approximate unexplained portion of each jump per the lineup notes; six smaller jumps are in Table 2 and the lineup CSV. Nvidia's supply jumps are not leases but are the filing items behind its commitment growth. *Source:* Lease-dollar lineup (Phase 2).

Table 3. Main results: the attribution waterfall by company (USD billions).

Company	Total	Strong	Plausible	Weak	Unattributed
Microsoft	329.10	0.00	0.00	0.00	329.10
Meta	279.00	12.31	0.00	0.00	266.69
Oracle	274.00	0.00	14.00	0.00	260.00
Amazon	137.20	0.00	0.00	0.00	137.20
Alphabet	85.20	0.00	0.00	0.00	85.20
CoreWeave	35.50	26.54	0.00	0.00	8.96
Nvidia	25.00	0.00	0.00	0.00	25.00
Total	1,165.00	38.85	14.00	0.00	1,112.15
Share	100%	3.3%	1.2%	0.0%	95.5%

Notes: Oracle at the $274B midpoint of the $260–288B range; at the endpoints the total is $1,151B/$1,179B, Strong is 3.4%/3.3%, and unattributed is $1,098.15B/$1,126.15B. Weak carries $0.0B in dollars at every company by construction (named-but-unsized tenancies are not assigned dollars). Plausible is the single Saline floor proxy (Section 6.1). *Source:* Attribution rebuild, 31 audit rows (Phase 2).

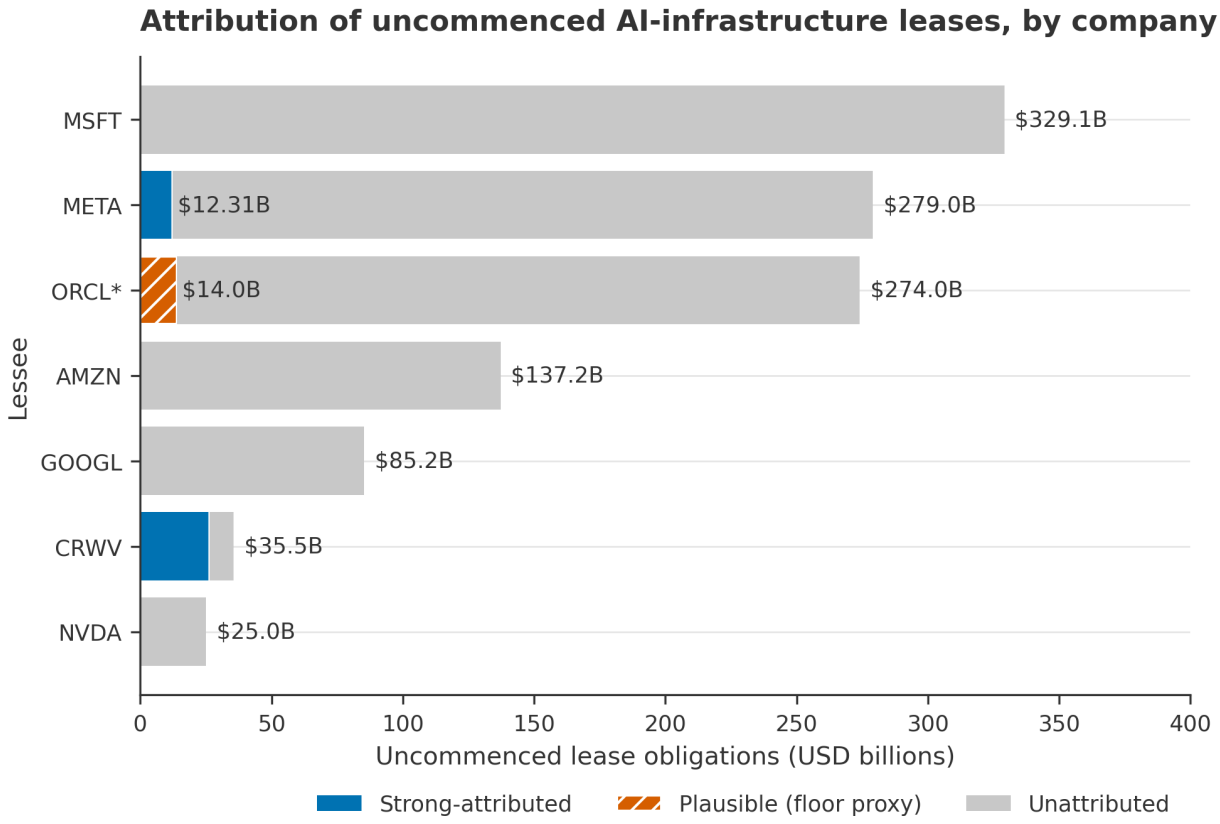

Figure 3. Attribution of uncommenced AI-infrastructure leases, by company.

Note: Oracle at the $274B midpoint of the $260–288B range. Weak buckets carry $0.0B in dollars at every company. Plausible is a floor-proxy bucket (see text). *Source:* Attribution rebuild (Phase 2).

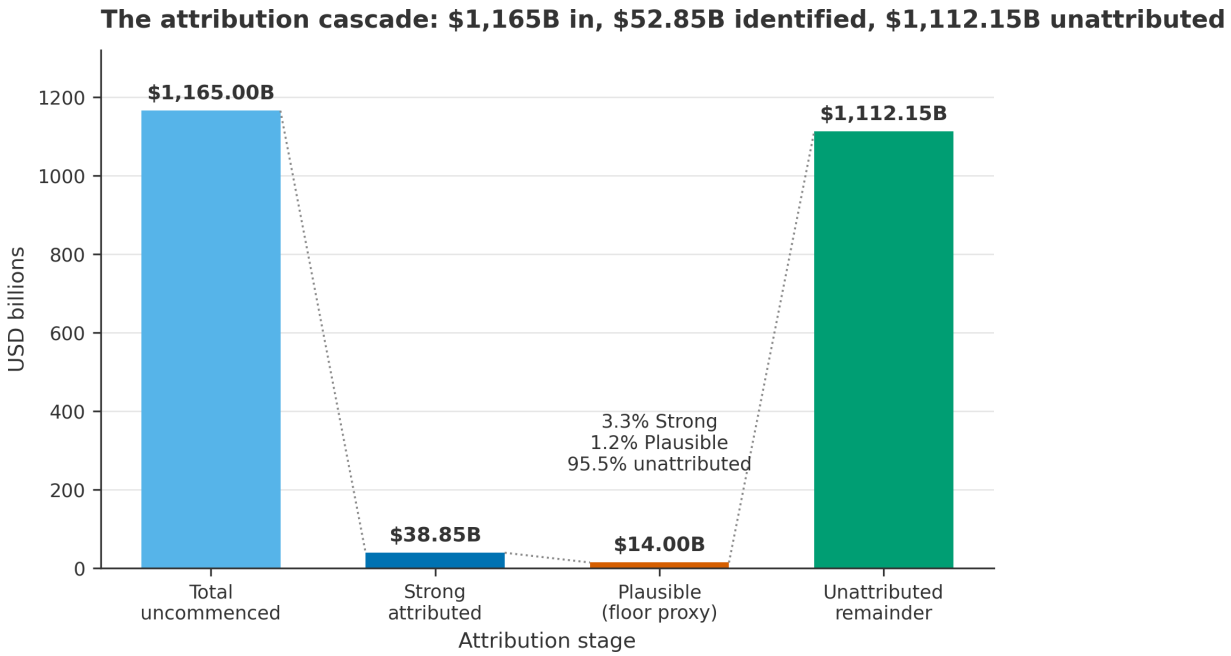

Figure 4. The attribution cascade: $1,165B in, $52.85B identified, $1,112.15B unattributed. *Note:* 3.3% Strong, 1.2% Plausible, 95.5% unattributed at Oracle's $274B midpoint. *Source:* Attribution rebuild (Phase 2).

hell-or-high-water lease (tenancy corroborated three ways, economics undisclosed), the Oracle 4.5 GW lease stack (the $300B/5-year and $400B/3-year figures are program partnership values, not Oracle lease obligations), the Nscale–Microsoft $43.8B (a global take-or-pay services contract through December 2033, not a lease and not Narvik-specific), and Sopaipilla (timing-excluded). The round-1 headline was $28.45B (2.4%) Strong; Phase 2 adds $10.4B of Strong (Helios) and $14.0B of Plausible (Saline). The verdict is unchanged in kind: the book remains overwhelmingly unattributable, and that is now a measured quantity.

6.3 The governing limit: why the remainder is measured

The 95.5% is not an argument from ignorance. It is bounded on one side by the verified governing limit of Section 2.3 and on the other by 46 forensic workstreams that harvested every side door in Table 4. The logic is: (i) the law requires totals, not names, so the unattributed remainder is the expected outcome of the disclosure regime, not evidence of evasion; (ii) the workstreams checked every channel through which names *can* enter the public record, and the harvest is documented row by row in the 348-row coverage matrix (121 findings, 60 nulls, 155 not-attempted, 12 not-applicable); (iii) the nulls are themselves findings about the regime (Section 6.8), and the remaining not-attempted rows are listed in Section 6.9 as exactly what would shrink the remainder.

Two asymmetries sharpen the point. First, the lessor side is sometimes *more* disclosing than the lessee side: Applied Digital's 10-K names CoreWeave with MW, term, and dollars while CoreWeave files no lease exhibit; the KBRA Saline presale names Oracle while Oracle's filings name nothing. The binding constraint is on whichever side chooses silence, and the law permits both sides to choose it. Second, the side doors are narrow by design: Reg AB Item 1112 names tenants only at 10%

Table 4. The disclosure side doors: where counterparty names can enter the public record.

Side door	Legal basis	What it yields	Program status
ABS significant obligors	Reg AB Item 1112	Tenant name at ≥10% pool concentration	Checked; no Oracle/Amazon/Google/Nvidia names found
BDC investment schedules	Reg S-X 12-12	Every obligor named, no materiality threshold	Harvested (CGBD/CoreWeave $60.5M; ARCC/Vantage)
Registered-fund holdings	Form N-PORT	Bond holdings by CUSIP, 60-day lag	Harvested: 411/104/70 funds (Section 6.8)
Related-party transactions	Reg S-K Item 404(a)	Names, amounts, terms (≥$120k)	Harvested (APLD; WULF)
Beneficial ownership	Sch. 13D/G	5%+ holders named	Harvested (CRWV/APLD; NVDA/NBIS; MS/WULF)
Reg D offerings	Form D	Related persons, amounts sold	Null: no SPV filings found
Wholesale power sales	FERC EQR, 18 CFR 35.10b	Named counterparties	Deprioritized (campuses are load, not sellers)
County deeds/mortgages	State recording statutes	Grantor/grantee/borrower/lender/amount	Zero mortgages found for $38B/$18B facilities
UCC-1 statements	UCC Article 9	Debtor/secured party/collateral	Blocked: TX paid-only; WI/NM unreachable
State utility dockets	State tariff rules	Customer names where unsealed	Harvested: PUCT names loads (Crusoe; Wurldwide)
IRBs / EMMA	Rule 15c2-12	Obligor/tenant/structure	Harvested: Jupiter $165B ceiling; 144A has no EMMA by construction
Permits (air/water/building)	State programs	Applicant/operator	Harvested (ECHO: Laidley; Evest)
Import manifests	19 CFR 103.31(a)	Consignee, quantity	Harvested: Crusoe BESS; zero GPUs (opt-out limit)
Lobbying disclosures	2 U.S.C. 1603–1604	Client, issues	Adjacent, not harvested

Source: Disclosure-surface map and legal verification (Phase 1/2). "Blocked" and "Null" are graded findings about access and coverage, not team failures.

pool concentration; N-PORT sees only registered funds (about 95% of the Sopaipilla and Helios issues sits with holders it cannot see); BDC schedules are the strongest naming regime in the federal securities laws but cover only BDC-held paper. The remainder is therefore structural: it is the set of obligations for which no side door opened, and the program verified that the doors it could open were opened.

The twelve previously unreported findings that lead this paper are collected in Table 5. Each is tagged by novelty class: (a) previously unreported, (b) primary-source confirmation of press, (c) well covered. The table shows only the (a)-class; the (b)-class confirmations (the $38B Stargate tranches, the $18B Jupiter facility, the Beignet terms, the Nscale S-1 economics, the Jupiter IRB instruments, Digital Realty's tenant naming, the Vantage UK charges, the NVIDIA $105B RVG filing-to-press match) are carried in the deal anatomies and the text.

Table 5. The twelve (a)-class contributions: previously unreported findings.

Finding	Grade	Section
Saline KBRA lease: four triple-net leases to Oracle America Cloud Services LLC, guaranteed by Oracle Corp.; first named-tenant/named-guarantor AI-campus lease	(Observed, B)	6.5
Jupiter SPV renames (Green Chile → Oracle America Cloud Services; Red Chiles → Aggregators; Yucca → Forge Growth) at unchanged DE file numbers	Inferred	6.5
Michigan DTE customer and Jupiter NM tenant resolve toward the same entity lineage	Inferred	6.5
Jupiter lease is 18-year hell-or-high-water; Oracle's Sep 24, 2026 force-majeure notice is the first in an AI build	(Observed, C)/(Observed, B)	6.5
Oracle-signs-the-Stargate-leases synthesis: Oracle is the lessee across Jupiter, Abilene/Shackelford, Wisconsin, and Saline to fulfill OpenAI's $300B/5-yr compute contract	(Reconstructed, B)	6.5
NPORT holder maps: Beignet 411 funds/$9.78B; Sopaipilla 104/$418M; Helios 70/$189M; ∼95% of two issues invisible to NPORT	(Observed, A)	6.8
Empirical 13F blindness: ∼54,000 positions, zero 144A CUSIPs; zero-UCC/zero-mortgage nulls as named blockers	(Observed, A)	6.8
Authorization-is-not-issuance corrections: Jupiter $165B, Mica $10B, Kestrel $100B are conduit ceilings, not sold bonds	(Observed, A)/(Observed, B)	6.5
Helios $10.4B lease + uncapped Galaxy completion guarantee + QOZB HoldCo	(Observed, B)	6.5
SB Energy S-1 lease exhibits 10.28/10.29 (the corpus's only filed leases); $105B NVIDIA RVG	(Observed, A)	6.5
Nscale UK charge-register mapping ($900M revolver package; $105M Macquarie correction); SoftBank Yuho verified nulls	(Observed, A)	6.5
Transmission-docket constraints (Port Washington revocation; Mount Pleasant FERC fight); WV HB 2014 state preemption; the behind-the-meter turn	(Observed, A)/(Observed, B)	6.5

Notes: "Inferred" marks registry-rename findings whose amendment records are paywalled. Full (b)/(c) classifications are in the Phase 2 novelty record. *Source:* Phase 2 novelty tags.

6.4 The counterparty network and concentration

The rebuilt network has 131 nodes and 141 edges across nine clusters (Section 5.3 for build rules). Figure 5 shows the full graph; Figures 6 and 7 rank the most-connected and largest nodes. Nscale PLC is the degree center (18 counterparties) and the dollar center ($120.6B of connected financial-flow dollars), followed by NVIDIA ($111.1B), SB Energy ($108.8B), and SoftBank ($80.5B) on the dollar ranking. The lessee nodes themselves (Microsoft, Meta, Oracle, Google) sit at degree 5 to 7: the graph is dense around funders, developers, and vehicles, and sparse around the lessees, which is the network analogue of the attribution result.

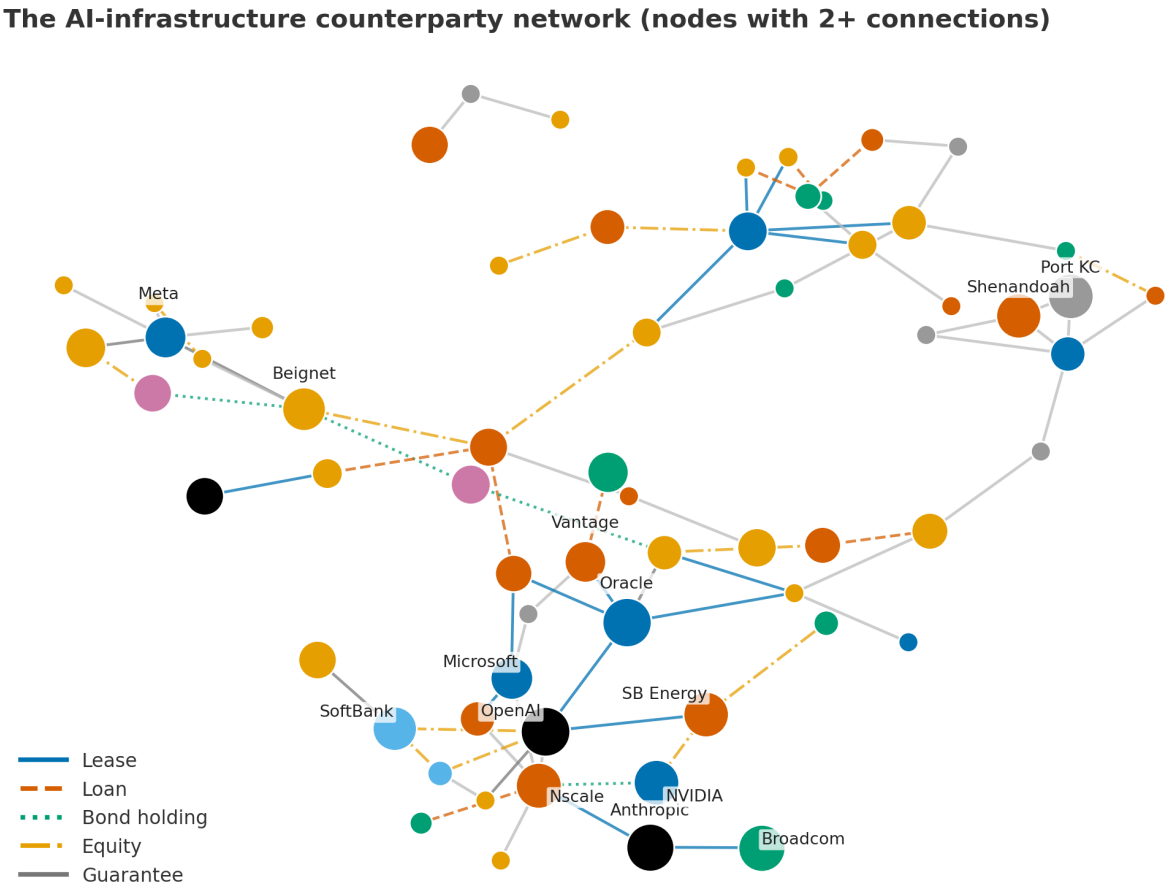

Figure 5. The AI-infrastructure counterparty network (nodes with 2+ connections).
Note: Node size scales with connected financial-flow dollars; edge style encodes edge type (lease, loan, bond holding, equity, guarantee). Development and conduit-authorization edges are excluded from the dollar ranking. Labels show the 14 largest nodes. *Source:* Network rebuild, 131 nodes / 141 edges (Phase 2).

The structural concentration findings matter more than the ratios. First, Blue Owl is the common capital partner across four clusters, now documented at the entity-formation level: the Beignet Investor family shares United Agent Group Inc with all 12 Red Chiles (Jupiter) entities, and OpenCorporates attributes the Red Chiles controlling company as Blue Owl Real Estate Net Lease Trust (Observed, B)/(Observed, C); Blue Owl also holds 80% of Beignet (∼$7B check), sponsors Digital Drive, and sits in the Crusoe Abilene JV via Blue Owl Real Assets. A Blue Owl-level stress event would touch Meta's, Oracle's, and CoreWeave's identified capacity simultaneously.

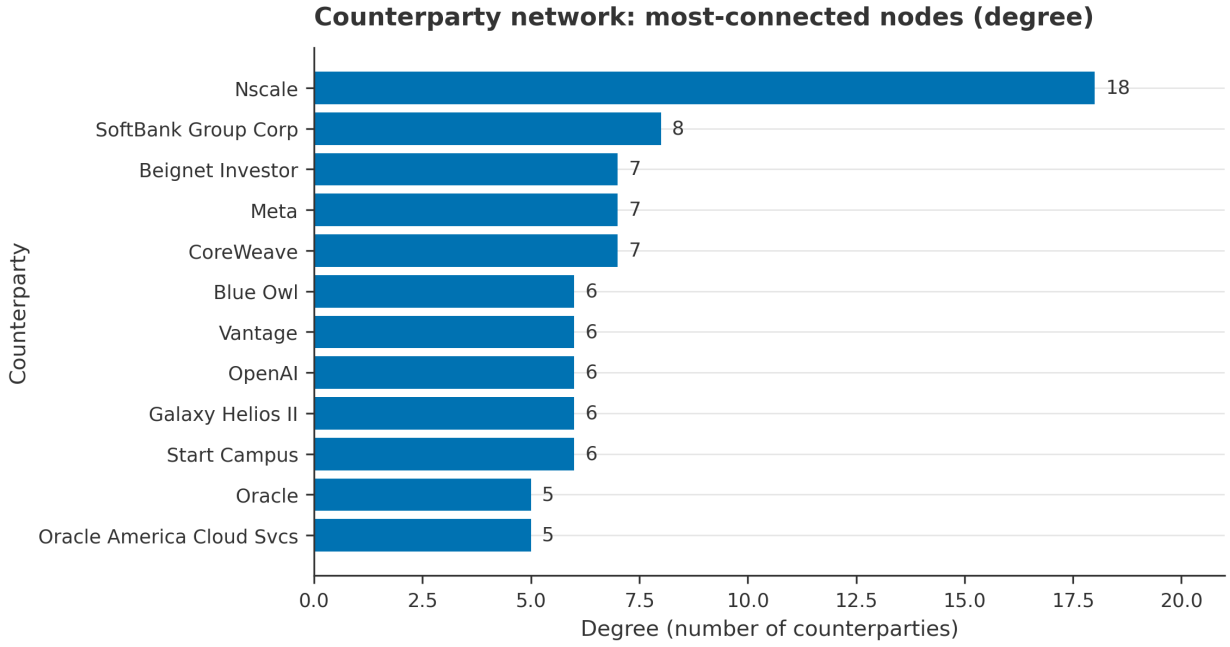

Figure 6. Counterparty network: most-connected nodes (degree).
Source: Network rebuild centrality (Phase 2).

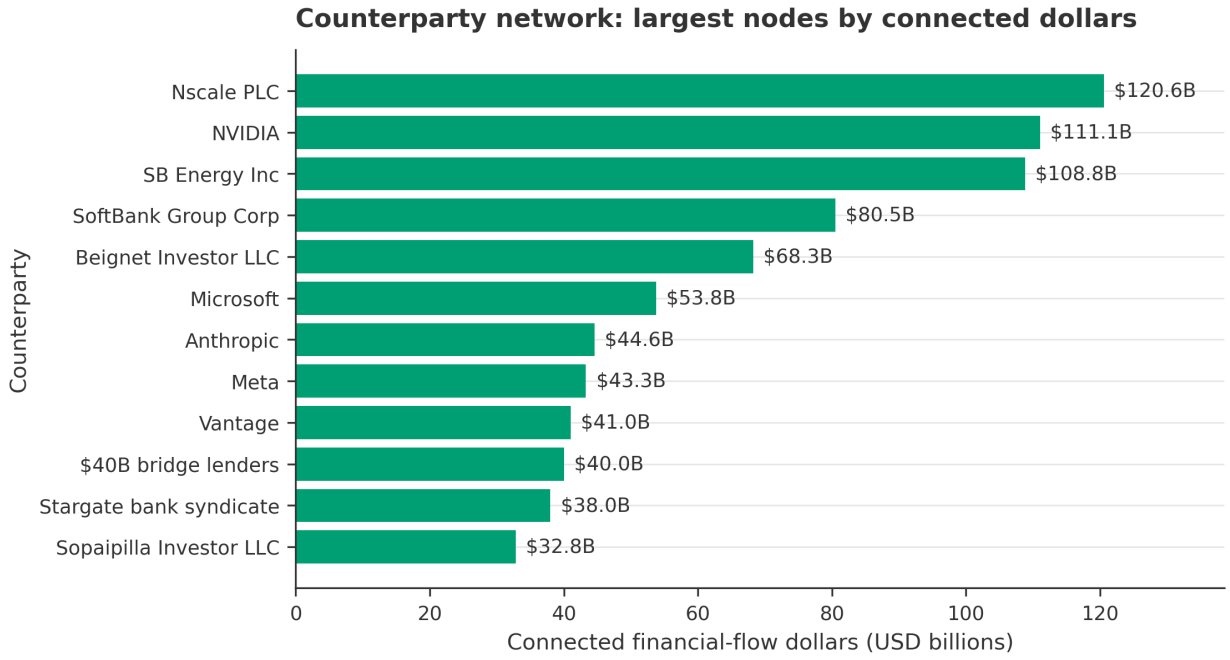

Figure 7. Counterparty network: largest nodes by connected dollars.
Note: Strict financial-flow basis: development edges (project costs) and conduit-authorization edges (ceilings, not issued debt) excluded. *Source:* Network rebuild centrality (Phase 2).

Second, Vantage is the Stargate construction nexus ($41.0B connected: $38B facility + $3B equity commitment), but the lease legs behind it are the graph's largest unquantified edges. Third, Nscale's customer concentration is disclosed by the company itself: the largest customer is 73% of revenue on a $103.4B take-or-pay TCV (S-1) (Observed, A), a supplier-side concentration figure, not a lessee-side one.

Table 6 gives the per-lessee concentration on the attributable sample. CoreWeave is the only lessee with a multi-counterparty attributable book and it is highly concentrated: the top three counterparties are 91.7% of the attributable $26.54B. Meta's and Oracle's "100%" figures are single-project artifacts (Hyperion is the only facility-level lease number in Meta's filings; Saline is a single floor proxy). For Microsoft, Amazon, Google, and Nvidia the concentration question cannot be answered: $1,076.5B of the $1,165B book (92.4%) has no attributable counterparty at all.

Table 6. Per-lessee counterparty concentration on the attributable sample.

Lessee / counterparty	$B	Share of attributable	Share of lessee total
CoreWeave ($26.54B attributable; 74.8% of its $35.5B)			
Applied Digital (Polaris Forge 1)	11.00	41.4%	31.0%
Galaxy Helios Data Centers II LLC	10.40	39.2%	29.3%
Blue Owl Digital Drive SPV	2.94	11.1%	8.3%
Elk Grove Village Property LLC	2.20	8.3%	6.2%
Top-3 share of attributable		*91.7%*	
Meta ($12.31B attributable; 4.4% of its $279B)			
Pelican Leap LLC via Beignet Investor LLC	12.31	100%	4.4%
Oracle ($14.00B Plausible; 5.1% of $274B midpoint)			
RD Michigan Property Owner I LLC	14.00	100%	5.1%
Microsoft, Amazon, Google, Nvidia	0.00	n.a.	n.a.

Notes: Ratios on the 4.5% attributable sample are illustrative, not representative of the full book. Oracle's figure is the Saline floor proxy, not the lease total. *Source:* Concentration analysis (Phase 2).

6.5 Deal anatomies: seven financing stacks

Figure 8 scores each deal's financing-stack completeness; Table 7 gives the standardized cross-deal comparison. Galaxy Helios is the most completely documented single-tenant lease financing in the program (87.5%): named tenant, named lease economics, named parent completion guarantee, and named bookrunners in one filing set. Project Jupiter is the least (52.5%): the entire equity layer is blank, lease economics are undisclosed, and facility pricing is unsourced.

Beignet / Hyperion (Meta, Richland Parish LA), 82.5%. $27.294B 6.581% senior secured notes due 2049 (144A/Reg S, S&P A+); Blue Owl-managed funds 80% (∼$7B check), Meta 20% via Iris Crossing LLC → Project Beignet Holdings LLC (Observed, B); Meta's lease $12.31B initial via Pelican Leap LLC with ∼$28B declining residual-value guarantee and $46.03B maximum exposure (10-Q Q2 2026) (Observed, A); NPORT maps 411 funds / $9.78B (PIMCO complex $6.66B,

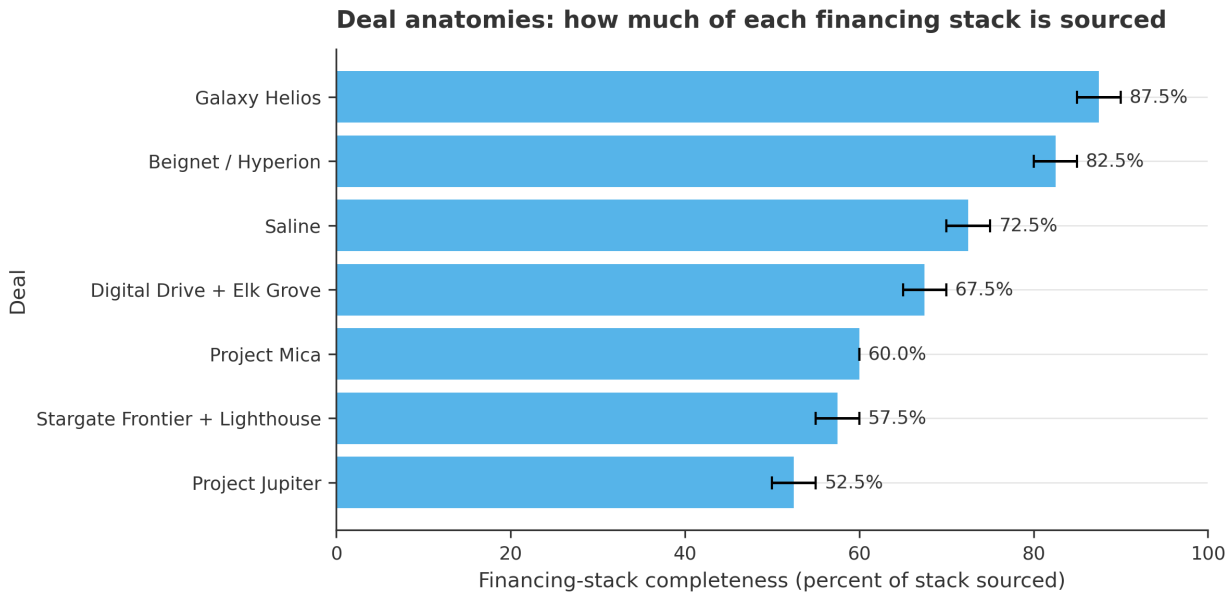

Figure 8. Deal anatomies: how much of each financing stack is sourced.

Note: Completeness is the desk's judgment of sourced versus unsourced stack layers (RECONSTRUCTED, C); error bars show the stated ranges. Mica is scored as a tax/incentive structure (authorized, not issued). *Source:* Deal anatomies v2 (Phase 2).

BlackRock $1.05B) with ∼$6B still unnamed (OBSERVED, A). Largest unsourced: Meta's 20% check size; the phase-2 funding vehicle; a possible second tranche (6.850% due 2049) is unverified, so the $27.294B should not be cited as a single tranche.

Stargate Frontier + Lighthouse (Oracle/OpenAI via Vantage), 57.5%. $38B mini-perm ($23.25B TX + $14.75B WI; SOFR+∼2.5%; 20+ banks; JPMorgan + MUFG lead) (OBSERVED, B); Silver Lake/DigitalBridge ∼$3B equity (OBSERVED, B); the lease leg is entirely unsourced (no rent, tenor, or tenant entity in any primary record). Transmission is the binding constraint at Lighthouse: ATC docket 137-CE-221 completeness was revoked September 10, 2026 (the first such revocation in the PSC's 95-year history), refiled at $2.48–2.72B, with material risk of missing Oracle's H2 2027 guidance (OBSERVED, A)/(OBSERVED, B). Port Washington's original proponent was Cloverleaf Infrastructure; Vantage acquired its contracts and site plans (OBSERVED, A). Distribution status: as of October 10, 2026 the bank group had spent 6+ months distributing the $38B, with pieces offered to non-bank buyers at a discount (OBSERVED, B).

Project Jupiter (Oracle via Stack/Blue Owl, Dona Ana County NM), 52.5%. ∼$18B construction facility (∼20 banks; quoted 89–91c September 2026; syndication stalled) (OBSERVED, B); $165B IRB ceiling as tax pass-through (2025A $15B + 2025B $25B + 2025C ∼$125B; 2025C-1 $124,999,925,000 with purchaser Oracle America Inc) (OBSERVED, A); tenant vehicle renamed Green Chile Ventures LLC → Oracle America Cloud Services LLC at unchanged DE file number (INFERRED, ;) 18-year hell-or-high-water lease with Stack Infrastructure (OBSERVED, C); Oracle's September 24, 2026 force-majeure notice (the first in an AI infrastructure build) preserves development-stage rent (∼9% yield) over the ∼11% completion yield if the campus misses 2028 (OBSERVED, B). Power is unresolved: the Energy Transfer pipeline was rerouted after the NM State Land Office denied it twice, pushing in-service to about February 1, 2027, and the 2.45 GW Bloom fuel-cell microgrid replaced scrapped gas plants after 7,000+ opposing comments (OBSERVED, B).

Digital Drive + Elk Grove Village (CoreWeave via Blue Owl), 67.5%. Digital Drive: $1.1B 9.25% notes priced September 23, 2026 (S&P BB-, Goldman-led); sponsors Blue Owl affiliates + Cedarwood Investment Group + PowerHouse Data Centers (OBSERVED, B); 76 MW fully leased to CoreWeave, 15-year $2.94B (∼$196M/yr); the issuer SPV's legal name is still unidentified (the top persistent unknown). Elk Grove: borrower Elk Grove Village Property LLC, wholly owned indirect subsidiary of Prime Data Centers LLC (Macquarie-backed) (OBSERVED, B); $850M upsized to $900M (June 2026, Santander-led); 15-year ∼$2.2B lease (∼$147M/yr), two 7-year renewals, tenant pays substantially all opex.

Galaxy Helios (CoreWeave, Dickens County TX), 87.5%. CoreWeave Inc. under a Data Center Lease dated August 8, 2025 as amended: Phase II 260 MW critical IT, 15-year + two 5-year extensions, $10.4B minimum contracted payments (excluding a $100M option payment received), CPI 3–5% escalator, near triple-net, 13.7% starting MRC yield on cost, rent commencement Q2 2027 (OBSERVED, B); $3.507B 9.875% senior secured notes due 2031 (priced July 23, closed July 28, 2026, at 99.5; 144A/Reg S) with first-priority liens and an equity pledge (OBSERVED, A)/(OBSERVED, B); an *uncapped* completion guarantee from Galaxy Digital Holdings LP (OBSERVED, B); HoldCo Galaxy Helios II Qualified Opportunity Zone Business LLC (QOZB tax structuring); bookrunners Morgan Stanley + Goldman Sachs; NPORT maps 70 funds / $189.0M (5.4%; CUSIP 36322DAA4 identified from NPORT-P itself) (OBSERVED, A).

Saline Township MI, "The Barn" (Oracle via Related Digital / Blackstone), 72.5%. Four triple-net leases to Oracle America Cloud Services LLC, guaranteed by Oracle Corporation (KBRA presale, May 2026) (OBSERVED, B); 974 MW; four buildings; date-certain rent commencement; no tenant termination for late delivery; lease dollars undisclosed. $14B 7.500% senior secured notes due 2045 (priced 98.75, closed April 24, 2026; 144A; KBRA BBB; PIMCO ∼$10B; ∼$2B sponsor equity) (OBSERVED, B); entity identity resolved (MPSC U-21990 named Green Chile Ventures LLC as the 1.4 GW DTE customer in December 2025; the May 2026 PA-198 and KBRA namings give Oracle America Cloud Services LLC; DE file 10292489 keeps the "inferred" label until the amendment record is seen). The tax fight is live: the township approved, limited, then reversed 5-0 under litigation threat (July 17, 2026); the State Tax Commission challenge (no valid Industrial Development District) is pending; the claimed investment is $43.1B.

Project Mica (Google, Kansas City MO), 60%. A tax structure, not a financing: Port KC authorized up to $10B taxable revenue bonds (July 28, 2025); Missouri Chapter 100-style conduit (Port KC holds title, leases back to the developer); no series has been sold or issued as of the latest Port KC materials; EMMA null verified (OBSERVED, B). Google confirmed as developer (February 13, 2026); ∼700 MW via the Nashua Power Station plus onsite substations; Evergy long-term agreement covering full energy costs for both KC campuses; 25-year 75% real-property exemption. The paper must not present the $10B as a capital raise.

6.6 Tier validation v2

The paper-24 Tier D/E inputs survive the Phase 2 evidence: 11 confirmed, 2 refined, 2 flagged (Table 8). Microsoft's Tier D is confirmed: the Nscale S-1 Microsoft agreements (∼$43.8B through December 2033) are a global take-or-pay GPU/AI-infrastructure *services* contract, not a lease and not Narvik-specific, so they are correctly excluded from uncommenced leases. Meta's Tier D is confirmed with the Sopaipilla exclusion standing (JV announced after measurement; $12.55B is bond principal). Oracle's Tier D is confirmed: the Saline lease leg is the first named-tenant lease but its dollars are undisclosed, so no Tier D input changes. Amazon's and Google's Tier D are

Table 7. Standardized comparison across the seven deal anatomies.

	Beignet	Stargate F+L	Jupiter	Dig.Drive+Ell Gr.	Helios	Saline	Mica
Location	Richland Parish LA	Shackelford TX; Ozaukee WI	Dona Ana NM	Richmond VA; Chicago IL	Dickens TX	Saline Twp MI	Kansas City MO
Lessee (named?)	Meta sub (yes)	Reconstructed	Oracle vehicle (yes)	CoreWeave (yes)	CoreWeave (yes)	Oracle entity (yes)	Google (developer)
Lease $ stated?	Yes ($12.31B)	No	No	Yes ($2.94B; $2.2B)	Yes ($10.4B)	No ($14B proxy)	n.a.
Debt	$27.294B notes	$38B facility	∼$18B facility	$1.1B; $900M notes	$3.507B notes	$14B notes	$0 (authorized)
Equity	Blue Owl 80%; Meta 20%	SL/DB ∼$3B	Blank	Unsourced	$350M (Ph.I)	∼$2B sponsor	n.a.
Guarantees	∼$28B RVG	None found	None found	Prime completion	Uncapped completion	Oracle Corp.	n.a.
Power	Entergy 2.26 GW; Evest proposed	Oncor (unconf.); We Energies 1.3 GW	Bloom 2.45 GW; pipeline delayed	Unsourced	ERCOT LLIS; >1.6 GW	DTE 1.4 GW + storage	Evergy (both campuses)
Tax	LED Act 730; PILOT 60–80%	TID $458M; RZ 312	IRB $165B ceiling; PILOT $360M/30yr	IL DC exemption	QOZB HoldCo	PA 198 (contested)	Port KC conduit $10B
Completeness	82.5%	57.5%	52.5%	67.5%	87.5%	72.5%	60%
Largest unsourced	Meta 20% check; ∼$6B holders	Entire lease leg	Entire equity layer	Issuer SPV; sponsor equity	Recorded deed of trust	Lease rent; STC decision	Bond sale (none)

Notes: Completeness is the desk's sourced-share judgment (RECONSTRUCTED, C). "Authorized" means conduit ceilings with no series sold. *Source:* Deal anatomies v2 (Phase 2).

confirmed (Mica is a conduit authorization, not a Google lease; the WULF backstop is a credit backstop, not a lease). CoreWeave's Tier D is confirmed with the identified subset refined +$10.4B (Helios). Nvidia's Tier D is flagged: the $2.3B gap ($25.0B paper-24 input versus $22.7B in the 10-K for FY2027–2030) is unresolved and retained at paper figures per the standing rule; its Tier E gains a new item to verify, the $105B SB Energy residual-value guarantee, the largest single new guarantee in the Phase 2 evidence.

Table 8. Tier validation v2: paper-24 Tier D/E re-check against Phase 2 evidence.

Company	Tier D (uncommenced leases)	Tier E (guarantees/commitments)
Microsoft	Confirmed	Confirmed
Meta	Confirmed (Sopaipilla exclusion stands)	Confirmed ($46.03B max loss)
Oracle	Confirmed	Confirmed
Amazon	Confirmed	Confirmed
Alphabet	Confirmed	Confirmed
CoreWeave	Confirmed; identified subset +$10.4B	Confirmed
Nvidia	Flagged ($2.3B gap stands)	New item to verify: $105B SB Energy RVG

Notes: 11 confirmed, 2 refined, 2 flagged. Q3 2026 10-Qs were not filed as of October 11, 2026. *Source:* Tier validation v2 (Phase 2).

6.7 The lessor mirror

The lessor side sometimes discloses what the lessee side hides, but rarely enough to close the gap. Digital Realty's signed-not-commenced backlog rose from $859M (Q3 2024) to $1,900M (Q2 2026) in annualized rent and its pre-leased MW under construction from 450.8 to 757.1 MW (Figure 9), confirming the demand side of the uncommenced balances without attributing a dollar to any named hyperscaler. The Phase 2 update overturns the round-1 "no tenant names" finding in one respect: Digital Realty's FY2025 10-K names Oracle (9.0% of ARR, 42 locations), Meta (1.6%), IBM, Equinix, and LinkedIn (Observed, A); the paired silence holds for Amazon and Nvidia but is not uniform. The graded mirror verdicts: CoreWeave Strong (Applied Digital names CoreWeave with MW, term, and dollars); Microsoft Plausible (Nscale, Nebius, Crusoe items, all unsized or services); Meta Plausible-thin (Nebius names Meta unsized; Hyperion is Meta's own disclosure); Oracle Plausible (Crusoe Abilene corroborated; Vantage/Stack financings with tenant implied); Google Plausible (WULF-Fluidstack backstop, unquantified); Amazon Weak and Nvidia Weak (total paired silence: no lease exhibits on the lessee side and no attributable lessor announcement). Roughly $440B (Meta + Amazon + Nvidia) sits in total or near-total paired silence.

6.8 Null results and their evidentiary weight

The nulls are findings about the disclosure regime, graded like everything else. First, *empirical 13F blindness*: ∼54,000 positions across BlackRock and Allianz AM 13F-HR filings contain zero 144A CUSIPs (Observed, A). This is a coverage finding, not a data failure: Exchange Act Section 13(f) covers equity securities only, so plain notes should not appear; the null confirms the 13F route is legally blind to campus debt. Second, the *NPORT holder maps* (Table 9, Figure 10): Beignet 411 funds / $9.78B (35.8% of the $27.294B issue; CUSIP 076912AA2), Sopaipilla 104 funds / $418.2M (3.3%; CUSIP 83577VAA8), Helios 70 funds / $189.0M (5.4%; CUSIP 36322DAA4 identified from NPORT-P itself) (Observed, A). The structural finding: roughly 95% of the Sopaipilla and Helios

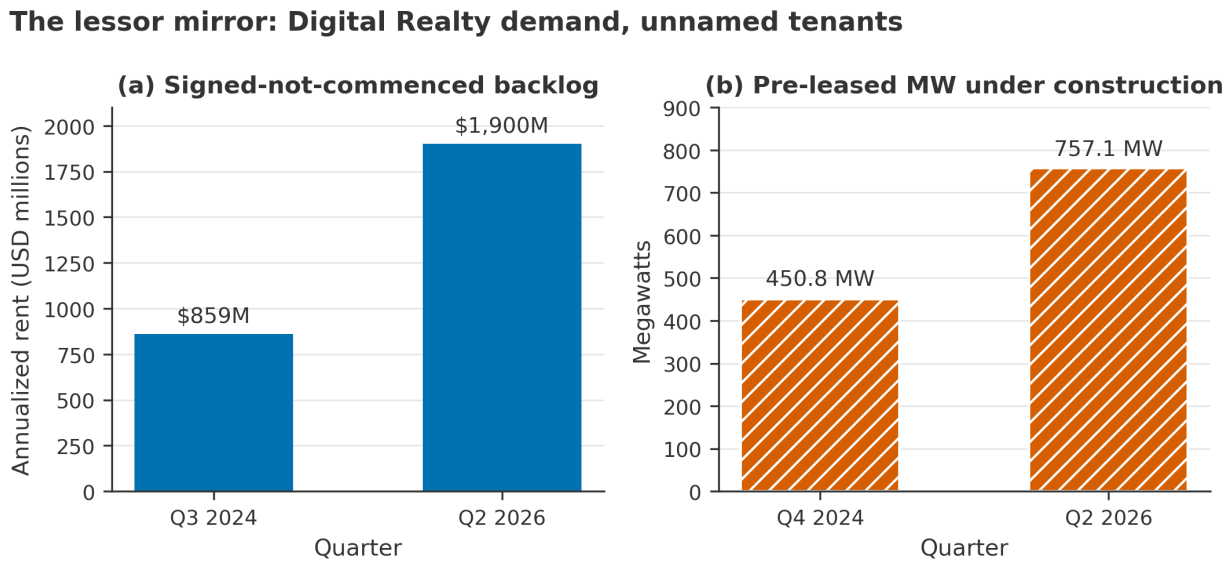

Figure 9. The lessor mirror: Digital Realty demand, unnamed tenants.

Note: (a) Signed-not-commenced backlog in annualized GAAP base rent; (b) pre-leased MW under construction. Neither panel attributes signings to a named hyperscaler. *Source:* DLR earnings supplements via the lease-timeline panel.

issues sits with holders NPORT cannot see (private funds, CLOs, insurers, banks); Beignet's larger mapped slice reflects anchor-size registered-fund holdings (PIMCO complex $6.66B, BlackRock $1.05B). A data-quality finding rides along: several NPORT-EX exhibits are stale versus their own primary XML, and the XML is treated as authoritative. Third, the *zero-UCC / zero-mortgage nulls*: no recorded mortgage or deed of trust for the $38B Stargate or $18B Jupiter facilities, and zero UCC-1 searches executable (TX SOSDirect paid-only; WI DFI and NM SOS unreachable from this environment) (Observed, B). These are named blockers, not data failures. Fourth, *SGX/ASX naming nulls verified as deliberate anonymization practice* (Keppel DC REIT, Digital Core REIT, NEXTDC name no tenants) (Observed, B). Fifth, the *SoftBank Yuho verified null*: no Stargate JV guarantee disclosed; financial guarantee contracts total only ∼$45M (Observed, A). Sixth, *zero GPU shipments* consigned to any target entity in free vessel-manifest data, bounded by the 19 CFR 103.31(d) opt-out that sophisticated importers routinely use (Observed, B). Seventh, the *cloud-bucket null*: 187 queries across three rounds found zero target documents in public cloud storage; the governing hypothesis stands that the counterparties' deal documents are not in publicly indexed storage (Reconstructed, B).

Table 9. NPORT holder maps: three campus note issues.

Issue	Coupon / maturity	CUSIP	Funds	$ mapped	Share of issue
Beignet	6.581% due 2049	076912AA2	411	$9.78B	35.8%
Sopaipilla	7.534% due 2048	83577VAA8	104	$418.2M	3.3%
Helios	9.875% due 2031	36322DAA4	70	$189.0M	5.4%

Notes: Top holders: PIMCO Income Fund $4.19B (Beignet); PGIM Total Return Bond Fund $76.3M (Sopaipilla); iShares Broad USD HY Corporate Bond ETF $34.0M (Helios). Helios CUSIP identified from NPORT-P itself. *Source:* N-PORT filings, July 31, 2026 period (Phase 2).

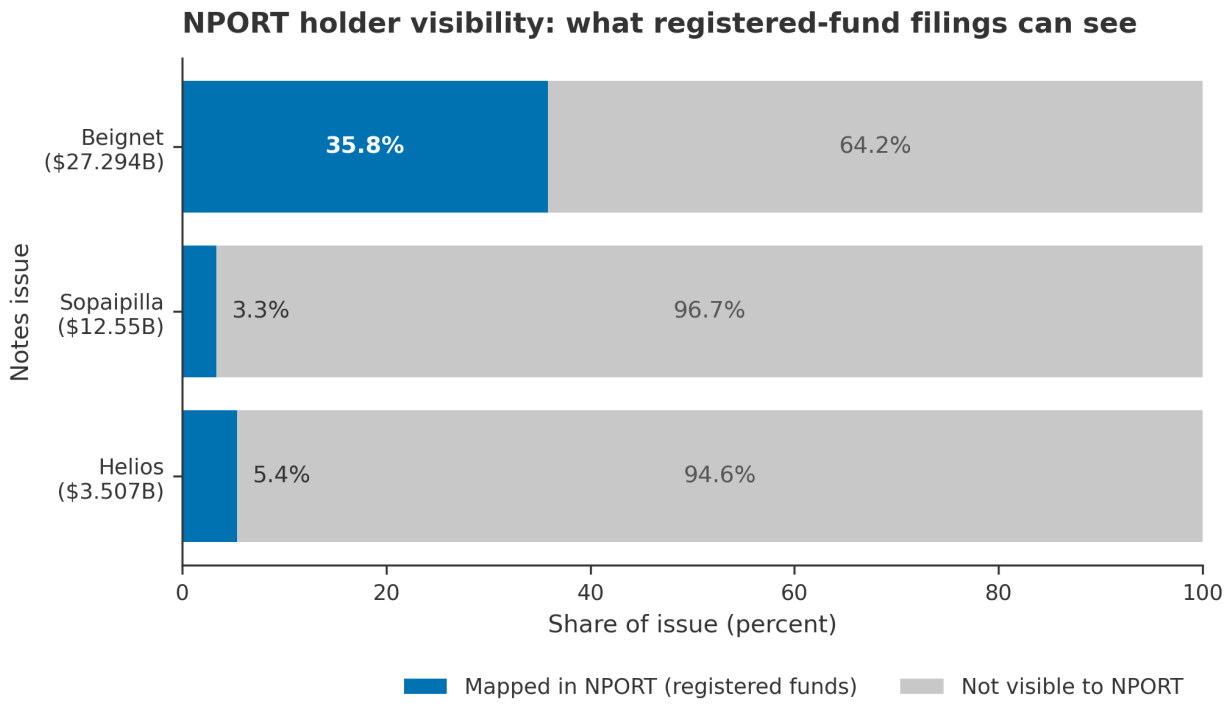

Figure 10. NPORT holder visibility: what registered-fund filings can see.
Note: NPORT covers registered funds only (60-day lag); private funds, CLOs, insurers, and banks are invisible by design. *Source:* N-PORT filings (Phase 2).

Table 10 collects the null register: what was sought, the verdict, and the evidentiary weight. The pattern across the nulls is consistent: where the law mandates naming (BDC schedules, Item 404, 13D/G), the program harvested names; where the law is silent or access is blocked (UCC portals, NAIC, county deed images), the null is documented with the blocker named.

6.9 What we are missing

The program's standing rule requires reporting what would shrink the unattributed remainder, not just what was found. Seven items would move the needle: (1) ABS presale tenant schedules (S&P Beignet full presale; KBRA/Moody's for Compass, EDI, Switch, DataBank), the likeliest home of Oracle/Amazon/Google/Nvidia tenant names, all login- or registration-walled; (2) executed mortgages/deeds of trust for the $38B Stargate and $18B Jupiter facilities (browser-blocked county portals); (3) UCC-1 searches (TX SOSDirect paid; WI DFI and NM SOS unreachable); (4) the KBRA Saline presale's stated annual rent, which would convert the $14B Plausible proxy into a Strong lease figure; (5) the Digital Drive lease signing date, which would confirm or remove the $2.94B from the June 30, 2026 total; (6) NPORT-P for the Beignet 144A tranche beyond the current pull ($9.78B mapped of $27.294B; ∼$6B of the issue still unnamed in any free source); (7) servicer distribution reports (Form 10-D) for outstanding data-center ABS, a proposed source not yet harvested. Adjacent gaps: the Digital Drive issuer SPV's legal name (the top persistent unknown); the Helios notes CUSIP beyond the NPORT identification; the new ATC docket number and its ∼October 19, 2026 completeness decision; the Oppidan/CLOP closing status (drop-dead December 31, 2026); seven unfiled FOIA drafts.

Table 10. Null register: sources sought and not found, with evidentiary weight.

Null	What was sought	Verdict and weight
13F blindness	144A CUSIPs in ∼54k 13F-HR positions	Zero hits (OBSERVED, A); coverage finding (13(f) is equities-only by statute)
Mortgages/deeds	Recorded security for $38B Stargate + $18B Jupiter | None found (OBSERVED, B); county portals JS-gated	
UCC-1 | Equipment/debt liens on campus SPVs | Zero searches executable (OBSERVED, B); TX paid-only, WI/NM unreachable		
SGX/ASX tenant names	Foreign REIT filings | Deliberate anonymization practice (OBSERVED, B)	
SoftBank Stargate JV guarantee	Yuho material contracts | Verified null: ∼$45M total guarantees (OBSERVED, A)	
GPU shipments | Vessel manifests to target entities | Zero (OBSERVED, B); bounded by 103.31(d) opt-outs		
Cloud buckets | 187 queries, 3 rounds | Zero target documents (RECONSTRUCTED, B)		
NAIC Schedule D | Insurer bond holdings | Closed: no paid data (program rule)		
Beignet 2nd tranche | 6.850% due 2049 snippet | Unverified; do not cite $27.294B as one tranche		

Source: Known-unknowns register and workstream nulls (Phase 2).

6.10 Falsifiers

The headline (95.5% unattributed, bounded by the governing limit) would be proven wrong by any of the following: a filed lease exhibit or 8-K naming an Oracle, Microsoft, Amazon, or Google campus counterparty with stated economics totaling more than $50B (which would move Strong past 8%); a complete ABS presale rent roll naming the hyperscaler tenants behind the anonymized multi-tenant pools; a regulatory change requiring lessee-to-lessor naming, which would dissolve the governing limit itself; or the KBRA Saline presale's stated rent proving the $14B floor proxy wrong by more than 25% in either direction (which would revise Plausible, not Strong). The Oracle-signs-the-Stargate-leases synthesis would be falsified by a primary record showing OpenAI as the direct lessee on any Stargate site lease. The NPORT structural finding (∼95% invisible) would be falsified by a full holder list for the Sopaipilla or Helios issues showing registered funds above 25%. This is a retrospective analysis; there was no pre-registered plan.

7 Limitations and robustness

The headline survives every sensitivity the record supports, but the sensitivities are material and stated here with the numbers. First, the Oracle range: at the $260B endpoint the total is $1,151B, Strong is 3.4%, and unattributed is $1,098.15B; at the $288B endpoint the total is $1,179B, Strong is 3.3%, and unattributed is $1,126.15B. The conclusion does not move. Second, the Strong-only sensitivity: excluding the Saline floor proxy, identified dollars fall to $38.85B (3.3%); including it, $52.85B (4.5%). Both are reported because the proxy's identity is Strong while its dollars are not the lease figure. Third, the timing caveats in Section 6.1 (Helios quarterly home; Digital Drive signing date) could move up to $13.3B between Strong and subsequent-events on re-examination, but cannot move the unattributed share by more than about one percentage point in either direction.

Fourth, the definition gap: 10-K "not yet commenced" lines differ from the paper-24 uncommenced endpoints used here (Meta $103.77B versus $279.0B; Amazon $96.4B versus $137.2B; Google $58.5B versus $85.2B; CoreWeave $38.5B versus $35.5B; Nvidia $22.7B versus $25.0B) (Observed, A). The waterfall uses paper-24 definitions consistently; restating on 10-K lines would shrink the total but would not change the identified dollars, so the attributed share would rise only arithmetically. Fifth, source quality: several (a)-class findings rest on B/C or inferred sources (the KBRA presale via the tier sweep at grade B; the Jupiter lease terms at grade C; the Delaware renames inferred with amendment records paywalled; the Sopaipilla pricing at grade B). They are labeled as such and none carries Strong dollars except through the audited adjudications. Sixth, staleness: Q3 2026 10-Qs were not filed as of October 11, 2026; Beignet marks are fund valuations, not trades; the NVDA $2.3B Tier D gap and the CoreWeave $3.7B versus $4.2B post-period bond discrepancy ($0.5B) are unresolved. Seventh, coverage: 155 of 348 coverage-matrix rows are not-attempted, concentrated in browser-gated county portals and unfiled FOIAs; the unattributed remainder is therefore an upper bound conditional on the harvested surface, and Section 6.9 lists exactly what would lower it. No "Bolton" entity appears in any workstream memo, CSV, or timeline note; it is excluded rather than invented.

8 Conclusion

Of about $1,165 billion in signed-but-not-yet-commenced AI-infrastructure lease obligations, $38.85 billion (3.3%) can be tied to named counterparties with stated lease economics, $14.00 billion (1.2%) is Plausible on a conservative floor proxy for a single Oracle campus, and $1,112.15 billion (95.5%) cannot be tied to any counterparty with the public record available. That remainder is a measured quantity: the law requires lease totals, not counterparty names, and 46 forensic workstreams harvested every side door through which names can enter the public record. The search produced twelve previously unreported findings, from the first named-tenant/named-guarantor campus lease to the registry trail showing Oracle, not OpenAI, signs the Stargate site leases. The honest bottom line is that the question "who is owed the rent on the AI buildout" has almost no public answer, and the counterparty column behind the largest fixed-obligation book in the technology sector is nearly blank. What would fill it is known and listed; until then, anyone pricing the credit risk of these structures is doing so without it.

Acknowledgments

We thank the Phase 2 analytical team for the lease-dollar lineup, the attribution rebuild, the network rebuild, the concentration analysis, the deal anatomies, the tier validation, and the novelty tagging on which this paper is built from scratch.

B Data appendix

Series definitions. Uncommenced leases: lease obligations signed but not yet commenced, per paper-24 definitions (Kilambi Research, 2026), measured at June 30, 2026 (Oracle August 31, 2026; Nvidia July 26, 2026). Strong/Plausible/Weak/Unattributed: the adjudication buckets of Section 5.2. Evidence grades: (Observed, A) (primary/government/SEC), (Observed, B) (reputable press/company/credible secondary), (Observed, C) (thin/single-source), (Reconstructed, B) (desk-built from primary sources), *Modelled* (desk model output), Inferred (registry-rename findings with paywalled amendment records). Completeness scores (Figure 8) are the desk's sourced-share judgments (Reconstructed, C).

Outstanding unknowns carried forward. Digital Drive issuer SPV legal name; Helios notes CUSIP beyond the NPORT identification; Saline/Digital Drive/Elk Grove notes CUSIPs for N-PORT; ∼$6B of Beignet noteholders beyond PIMCO/BlackRock; the Beignet possible second tranche; the new ATC docket number and its ∼October 19, 2026 completeness decision; the Oppidan/CLOP closing status; the NVE waste-heat filing (November 15, 2026); the WVDEP R14-0042 final action (post October 30, 2026); the PUCT 59076 vote; seven unfiled FOIA drafts; the PUCT-interchange per-project naming verification; the Beignet tranche convertibility / 13F Official List check.

Source table. Table 12 lists the forensic workstreams, their missions, and their closing status.

Table 12. Forensic workstreams: mission and closing status.

Workstream	Mission	Status
A power queues	Interconnection queues, EEI compendia, FERC large-load dockets	Completed; queues.csv; per-project load queues do not exist by law
B property/UCC	Deeds, mortgages, UCC-1 across TX/NM/WI	Completed; zero mortgages found; UCC portals blocked
C permits/abatements	Air/water/building permits, Chapter 312, IRBs	Completed; TID $458M confirmed ($5M unexplained)
D BDC filings	BDC 10-K investment schedules (12-12)	Completed; CGBD/CoreWeave $60.5M; ARCC/Vantage
E ABS prospectuses	Rent rolls, Item 1112 significant obligors	Completed; no hyperscaler tenant names
F NAIC holdings	Insurer Schedule D; closed: no paid data (program rule)	
G REIT/developer	Lessor mirror (DLR/EQIX/IRM; developers)	Completed; DLR names Oracle 9.0% (Phase 2 update)
H exhibit review	10-K Item 15 lease/capacity exhibits	Completed; zero filed (compliant outcome)
I event studies	Credit-mark event windows from press prints	Completed; no daily CDS/bond series available
J holder mapping	13F-HR CUSIP search for notes; completed; ∼54k positions, zero 144A (coverage finding)	
K environmental/IRP	ECHO, air permits, utility IRPs	Completed; Laidley/Evest hits; Jupiter nulls
L import/customs	Vessel manifests (19 CFR 103.31)	Completed; Crusoe BESS 21 units; zero GPUs
M registries/FERC	DE/LA/TX/WI/NM registries; FERC filings	Completed; Jupiter renames (inferred)
N EMMA/lobbying	IRBs, EMMA, lobbying disclosures	Completed; 2025B $25B correction
O N-PORT	Registered-fund holdings of campus notes	Completed; 411/104/70 funds mapped
P EQR/PUCT	FERC EQR wholesale transactions; deprioritized (cost/benefit; campuses are load)	
Q minor sources	Form D, 13D/G, Item 404, TRACE, FAA, EIA-860	Completed; 13Gs + Item 404 hits
R foreign filings	Companies House, EDINET, SGX/ASX, Yuho	Completed; Nscale charges; Yuho nulls
S energy global	SB Energy / Energy Global / Milam / PORTS	Completed; S-1 exhibits 10.28/10.29
T county records	Deed/abatement records per county	Completed; browser-blocked portals logged

Workstream	Mission	Status
U cloud buckets	Public cloud-storage OSINT (3 rounds)	Completed; 187 queries, zero target documents
V site sweeps	TX/Midwest/South/Intl site evidence	Completed; force-majeure; Saline KBRA
W infra/FOIA/permits	Infra filings, FOIA drafts, building permits	Completed; 7 FOIA drafts unfiled
X new sites/bonds	New campuses, campus bonds, NPORT holders	Completed; Helios/Sopaipilla/Mica
Z coverage matrix	348-row harvest-vs-gap matrix	Completed; 121/60/155/12
Source archive	Primary-document archive with manifest	Completed; EDGAR UA 4 req/s
Lease timelines	1,327-row quarterly panel, 19 companies	Completed; Q1 2023–Q2 2026
Tier sweep	Tier D/E inputs per campus	Completed; Jupiter 18-yr lease (C)

C Production note

This paper was produced by Kilambi Research's quantitative research pipeline with AI assistance; all analysis was verified against source data. Figures were generated from the Phase 2 analytical record with the institutional chart style; every quantitative claim traces to a cited source or a stated desk computation.
